

We are proud to release a big new feature that is sure to give devops reason to cheer. Plus, industry news and a chance at a \$25 Amazon gift card from Uptime.com.

## What's Up at Uptime.com

### Feature Release: Group Checks Together

Group checks nest numerous checks for the testing, reporting, and monitoring of interrelated checks and systems. Customizable failure conditions and determine when your contacts are alerted. This exciting new feature is ideal for monitoring systems of checks, is easy to use and available to every Uptime.com user.

#### How Group Checks Work

Create a new check, or add existing checks to a group. If you use tags, group check setup is simple. Add the tag(s) you want to organize into a group and Uptime.com catalogs everything in one.

With up to 200 individual checks allowed within a group check (and the possibility of even more when you use tags), Uptime.com offers a powerful tool for grouping related checks to represent a single system.

#### Use Cases

Here are a few ideas to help get you started:

- Catalog interrelated checks into a single system
- Create a warning for widespread outages
- Give a system's owner unprecedented visibility and oversight
- Track load balancers

And much more in [our documentation for Group Checks](#).

### Filter URLs from a Transaction Check

Are scripts slowing down your transaction checks? A new field in the Auth & Settings step can help! Filter out javascript with regex capable filters that block these resources from the inspector and paint a clearer picture of load time.

More information is available in our [documentation](#).

## Industry News

### Best Practices for Reporting on Systems

The deeper integrated your systems, the more important it becomes to accurately report on the state of uptime.
